Dapp: you should know that...

- The current version is a test version that includes 'mock data'
- To enable access to all the functionalities a few addons should to be installed however Dapp can run without these addons.
- Addons are:
 - Ollama: LLM for *handwriting to txt* and *notes summarization*
 - Tesseract: *jpeg processing/OCR*
 - Poppler: *converting pdf to txt*
- A local model (qwen2.5vl:3b) needs to be downloaded for Ollama
 - qwen2.5vl:3b is 3.2GB
 - can be stored on a USB stick to be redistributed

Dapp: memory and CPU consideration

- Dapp is designed to optimize memory usage
 - EMR data are encrypted and compressed
 - features to transform jpeg documents into text are available
- Some features are CPU demanding and could take sometimes to compute

Validation and Verification!

- The note summarization feature needs additional validation
- The vital form intake process needs verification after each scan
- More complex LLM models could be substituted but comes at the cost of:
 - disk/memory space
 - performance (stronger CPU/GPU)
